Simplified UI Development

Flexible Enterprise
Integration Framework

Out-of-the-box Tools

Secure Single Sign On (SSO)

Custom Fields

Working from Your
Desktop with Sync

Rules Engine Integration

SOA Framework

User Personalization

Role Based Content Delivery

Auditing & Performance Monitoring

SOLUTION

Single Sign-On

enterprise portals can provide single sign-on capabilities between their users and various other systems. This requires a user to authenticate only once.

Enterprise Integration Framework

the connection of functions and data from multiple systems into new components/portlets/web parts with an integrated navigation between these components. Included multiple methods to integrate with external content and data.

Customization

Users can customize the look and feel of their environment. Customers who are using EIPs can edit and design their own web sites which are full of their own personality and own style; they can also choose the specific content and services they prefer. Also refers to the ability to prioritize most appropriate content based on attributes of the user and metadata of the available content. Can work both the Portal and your desktop becomes a seamless experience.

Personalization

Personalization is more about matching content with the user. Based on a user profile, personalization uses rules to match the "services", or content, to the specific user. To some degree, you can think of the two like this: customization is in hands of the end user, personalization is not. Of course actual personalization is often based on your role or job function within the portal context. User attributes are editable by Administrator..

CMS and Collaboration Engine

the integration of content provided by other portals, typically through the use of WSRP or similar technologies.

Access Control

the ability for portal to limit specific types of content and services users have access. This access rights may be provided by a portal administrator or by a provisioning process. Access control lists manage the mapping between portal content and services over the portal user base. Portal's performance monitoring by Administrator for better optimize resources.

FEATURES

Web-publishing

Web Content Structures and Templates

Unified Documents & Media

User-Driven Workflow & Approval

Documents can be uploaded and stored
in one file format

Drag-and-Drop Site Maps

User Defined Content Categories

Search Engine Optimization (SEO)

Asset Publisher

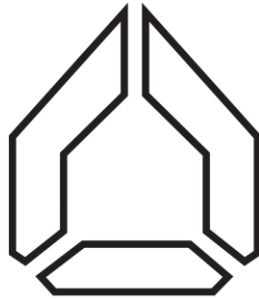

Multi-Language Support

Workspace Publishing

Workflow & Approval Process Driven
by the User
